

Suspension, Shock Absorbers & Steering System

It's a fact that shocks are not replaced as often as they should be, and tests show that weak shocks reduce handling stability, braking distances and overall driving safety.

Suspension & Shocks

If you have noticed your car is handling poorly, it could indicate a problem with your shock absorbers or suspension system.

Indicators of a problem like this are:

- Taking longer to stop (as much as 3m at 80kmph)
- Aquaplaning on wet roads
- Making noises when turning
- Having trouble cornering

Worn or leaking shock absorbers cause a decrease in braking distance which can cause your vehicle to fail its WOF inspection, however WOF inspections don't permit testing shocks and suspension directly.

Steering

The steering mechanism is designed to be sharp and responsive, letting the driver respond quickly to any changes in driving conditions. Your cars suspension, is designed to keep your tyres in contact with the road, eliminating road shock, thereby providing a more comfortable journey.

How we can help

We can Test your vehicle on our Safe T Stop this test your vehicle in less than 10 minutes. This unique machine allows us to detect any problems with your Shocks, Steering or Suspension for repairs and give you a free report
